Tunnel entrance from open pit

HISTORY

RED-MOUND TOURS takes its name from the three Red Knolls which dominate the landscape near Redmond, Utah. A hundred and fifty million years ago (during the Jurassic period) when great dinosaurs roamed the earth, Utah was part of an inland sea which dried up leaving a layer of salt 500 to 800 feet thick. Then a few million years later, as the mountains were formed and the earth shifted, the salt in this area was pushed to the surface, capturing some trace minerals right within the crystallization, thus a NATURAL TRACE MINERAL SALT. A real sea salt, full of natural minerals, all beneficial to men and animals. It is known world wide as REAL SALT. Indians first discovered it, early Pioneers uncovered it, and modern machinery developed it. The story is told in an interesting video, (SALT OF THE EARTH). Come visit us and hear 'the rest of the story'.
